[Heading:]

Should you be concerned about a wound that is healing too slowly?

[Body Copy]

If you have a wound that is slow to heal, an underlying health issue may be contributing to the problem. Just a few of the many conditions that may prevent healing are:

- **Diabetes**, which can lead to dangerous foot ulcers and even amputation
- **Peripheral Artery Disease**, which affects the health of skin on your feet and legs and can lead to a non-healing wound.
- **Chemotherapy and Radiation**, which can lead to serious skin damage and hinder healing

If you have a slow-healing wound, being seen by an experienced wound care specialist at Healogics can lead to quicker healing and prevent the serious complications of a chronic wound. Find a location near you, and explore how our expert wound care team can help.

Locate a Healogics Wound Care Center[®] today.
